

**Standardized operating processes  
increase quality and efficiency**

**It's all operative!**

## Operating-System Installation Predefined Processes Save Time and Money

The automated installation of a Windows operating system is an opportunity to reduce costs rapidly and above all sustainably in companies. By choosing Syconic, you acquire a client-management solution that makes it possible for you to create several operating-system definitions that are then distributed and installed via predefined operating processes. Thanks to these predefined operating processes and the resultant easy handling, we make it possible for you to implement and use Syconic quickly - without incurring the expenses of extensive training. This way, we can as a rule realise a return on investment for our customers in less than six months.

## Linux-based Installation

With Syconic you acquire a client-management solution based on the forward-looking Linux technology in the pre-OS phase. This precludes the problems with the installation of drivers for up-to-date hardware components that increasingly afflict the MS-DOS environment. If you are contemplating the introduction of a Linux operating system in the medium term, then Syconic provides the best presuppositions for support.

## Remote Booting

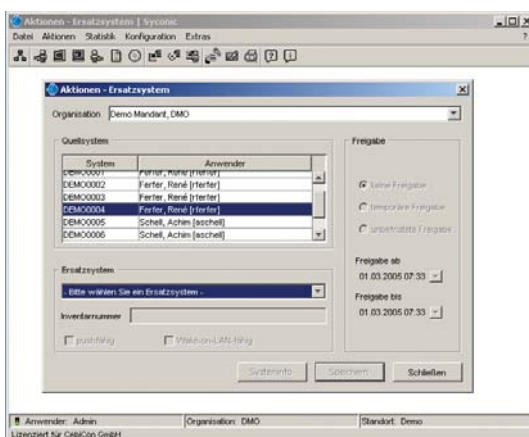

Syconic supports all normal boot procedures. Thus, in addition to the classical boot disc, CDs, DVDs and PXE are available as boot procedures. Thus, the system administrator can remotely install workstations. It does not matter whether the client has an installation that is no longer in running condition or whether it has just been delivered and does not yet have an installation. You are independent of the client's status. Naturally, depending on your hardware wake-on-LAN is also supported.

## System Platform

Thanks to the support for MS-SQL and Oracle databases, Syconic assures absolute data integrity and provides extensive evaluation opportunities for all organizational, inventory and status data on the basis of its fully integrated InfoZoom-Viewer by human IT. This makes it possible for you to evaluate and process the data of your client environment in various forms, and on the basis of the results to make qualified inferences on the state of the environment. Moreover, Syconic is able to collate relevant data with index services such as ADS and NDS via standardized LDAP protocols, thus avoiding redundant data collection.

## Individuality through Variables

Syconic supports the installation and configuration of clients on the basis of variables that can be freely defined. The administrator can thus dynamically implement configurations on the user's client down to the individual workplace and assign it whatever attributes he deems necessary. This results in a maximum of individuality for the user without compromising the automatic character of the operational procedures. The user therefore does not need to do any manual configuration work at the workplace.

## Software Distribution and Installation

### Open architecture protects investments

With Syconic, you acquire a client-management solution that will protect your investments in staff training and licences. In addition to our own CebiCon technology, with our open architecture we support software installation with the wide-spread technology NetInstall. Moreover, Syconic is also able to integrate existing SMS and MSI packages in the distribution.

### Automated Processes Assure Quality

We have integrated the experience that we have gained in many system- and network-management projects for you in Syconic. Using our predefined processes, you can distribute your software automatically, and are also in a position to react to any requirement in client operations - from the very first installation through application updates to recovery after a system crash - with a standardized procedure. This standardized procedure guides Syconic users so that errors are almost precluded. Thus, Syconic assures quality in your IT environment - today and in the future.

### Flexible Configuration – Automated!

Using the implemented variables tool in Syconic, you can also flexibly automate individual requirements on the software configuration. Independently of the distribution process used (push, pull, wake on LAN), features and configurations can be dynamically controlled in your software. This even includes system-specific parameters and environmental variables.

### Comprehensive Reporting

It is enormously important for all IT managers to be informed of the current status of their client environment at all times. For this reason, Syconic is equipped with numerous reporting instruments. Thus, for example, in case of migration or software rollouts, you can see at any time what progress the in-

stallation has made in the company, at certain locations or even in certain departments. You are also able to analyse the state of installation per client. Furthermore, you can receive at any time client-asset information or just-in-time licence reports.

### Fit-for-Audit Software Distribution

It is enormously important for companies to ensure that the software that is used is unequivocally registered. Syconic documents the time of assignment and successful installation. Furthermore, all changes such as updates and deinstallations are recorded in the database. By virtue of the assured integrity of the data and regular monitoring for any changes to the clients, Syconic guarantees that your licence administration is fit for auditing.

### **CebiCon – Simpel. Especial. Efficient.**

CebiCon GmbH is serving medium-sized companies and large-scale corporations such as T-Systems, Grüenthal and DFG Deutsche Forschungsgemeinschaft since 2000. The company, based in Bonn (Germany), develops and distributes products for an efficient system- and migration management since 2004. The products of CebiCon can also optimise and enlarge already consisting system management solutions. CebiCon GmbH is a microsoft gold certified partner.
